

I used the find and replaced function in Microsoft Excel to search the CSV file directly

After entering the postcode into the data field, I pressed the find all button. This tells Excel to search the CSV file for the data you have entered

I entered the postcode into the data field. The data entered into this field is what Excel will search for in the CSV file.

Here we can see that the postcode is not stored in the CSV file. This means the test was successful, however, my system should display a message if the postcode is not in the CSV file.
